New Crash Tests By Sleepypod Provide Enhanced Research Insights on Pet Safety in Cars

Crash Tests in Side Positioning Builds on Outcomes of Previous Upright Position Testing

PASADENA, Calif.—August 13, 2019—Sleepypod®, a Pasadena-based company known for redefining pet products, today presents new crash test research. Crash tests were performed to assess the effectiveness of Sleepypod’s Clickit Terrain car safety harness in restraining a pet while positioned in a side lounging position. These tests build on Sleepypod crash test research of a pet in an upright seated position.

Earlier Testing in Upright Seated Position

Previous crash test research by Sleepypod using its proprietary DUKE line of crash test dogs was performed with the crash test dog in a seated position. These earlier tests demonstrated the Clickit Terrain safety harness was successful in achieving Sleepypod’s criteria of keeping the crash test dog on the seat bench for the duration of the test while controlling rotation of the pet. New Testing in Side Lounging Position

Tests performed by a 45 pounds version of Sleepypod’s newest crash test dog, SCOUT 1.0, demonstrated the Clickit Terrain safety harness was also successful in achieving Sleepypod’s criteria of keeping the crash test dog on the seat bench for the duration of the test while controlling rotation. “Sleepypod is committed to building on its research of pet safety in vehicles,” says Michael Leung, Sleepypod co-founder and lead product designer. “By testing Sleepypod pet safety restraints using Sleepypod’s proprietary family of crash test pets, Sleepypod is better able to create safer, more reliable restraint designs. Sleepypod looks forward to sharing additional car safety research at a future date.”
